1 The scalar component is an optional value.. The rotation vector sensor and the gravity sensor are the most frequently used sensors for motion detection and monitoring. The rotational vector sensor is particularly versatile and can be used for a wide range of motion-related tasks, such as detecting gestures, monitoring angular change, and monitoring relative orientation changes.

Although the Generic Sensor API specification defines a Sensor interface, as a web developer you will never use it. Instead you'll use one of its subclasses to retrieve specific kinds of sensor data. For example, the accelerometer interface returns the acceleration of the device along all three axes at the time it is read.. Sensors may or may not correspond exactly to a physical device sensor.

A gravity sensor reports the direction and magnitude of gravity in the device's coordinates. The gravity vector components are reported in m/s² in the x, y, and z fields of sensors_event_t.acceleration. When the device is at rest, the output of the gravity sensor should be identical to that of the accelerometer.
