Hardy-Weinberg Practice Problems - ANSWER KEY 1. You have sampled a population in which you know that the percentage of the homozygous recessive genotype (aa) is 36%. Using that 36%, calculate the following: A. The frequency of the " aa " genotype (q^2). $q^2 = 0.36$ or 36% B. The frequency of the " a " allele (q). $q = 0.6$ or 60 % C.

Answer Key Hardy Weinberg Problem Set
 $p^2 + 2pq + q^2 = 1$ and $p + q = 1$
 p = frequency of the dominant allele in the population
 q = frequency of the recessive allele in the population
 p^2 = percentage of homozygous dominant individuals
 q^2 = percentage of homozygous recessive individuals

Genetic Mutation. BlackJack3D/E+/Getty Images. One of the conditions that must be met for Hardy-Weinberg equilibrium is the absence of mutations in a population. Mutations are permanent changes in the gene sequence of DNA. These changes alter genes and alleles leading to genetic variation in a population. Although mutations produce changes in the genotype of a population, they may or may not ...

Hardy-Weinberg Lab Introduction: In 1908, G. H. Hardy and W. Weinberg suggested a scheme whereby evolution could be viewed as changes in the frequency of alleles in a population of organisms. They established what is now known as the Hardy-Weinberg principle. The Hardy-Weinberg principle states: The frequency of an allele in a

Assuming that all of the Hardy-Weinberg conditions are met, how many of these would you expect to be red-sided and how many tan-sided? Answer: Simply put, The "A" phenotype = $0.584 \times 1,245 = 727$ tan-sided and the "a" phenotype = $0.416 \times 1,245 = 518$ red-sided (or $1,245 - 727 = 518$). PROBLEM #6.
