### The Neurobiology Of The Amygdala

Amygdala, region of the brain primarily associated with emotional processes. The name amygdala is derived from the Greek word amygdale, meaning "almond," owing to the structure's almondlike shape. The amygdala is located in the medial temporal lobe, just anterior to (in front of) the hippocampus. Similar to the hippocampus, the amygdala is a paired structure, with one located in each ...

This volume compiles the proceedings of a symposium held in Bar Harbor, Me, June 6 through 17, 1971, that gathered a large number of world experts on the amygdaloid nucleus. The subjects covered at that conference and published in this volume range from the development of the amygdaloid nucleus in...

Lesions of the amygdala block innate or conditioned fear, as well as various measures of attention, and local infusions of drugs into the amygdala have anxiolytic effects in several behavioral tests. N-methyl-D-aspartate (NMDA) receptors in the amygdala may be important in the acquisition of conditioned fear, whereas non-NMDA receptors are important for the expression of conditioned fear.

Moreover, it does so in a very unique way: if you suffer stress in childhood, it alters all that neurobiology related to what scientists call the “web of fear”. Regions such as the amygdala, the hippocampus, or the anterior dorsal cingulate cortex suffer small alterations that will increase the risk of suffering anxiety disorders in adulthood.

head, which receive projections from the amygdala and the orbital and medial prefrontal cortex (Ongur and Price 2000). The amygdala has also been implicated in the production of emotional states and behaviors. Bilateral lesions of the temporal lobes (Klüver and Bucy 1939), and, particularly, the amygdala (Zola-Morgan et al 1991) result in

Amygdala Damage Leads to Disturbed Management of One's Comfort Zone. The scale in (A) shows the chin-to-chin distance between experimenter and participant. A patient with bilateral amygdala lesion (B, red line and image) preferred closer distance to the experimenter (C, black image), without expressing any sense of discomfort, compared to 15 matched neurotypical controls (blue lines and image).

Dialectical behavioral therapy (DBT) was found to attenuate amygdala hyperactivity at baseline, which correlated with changes in a measure of emotion regulation and increased use of emotion regulation strategies. Taken together, these findings highlight that dysfunctional circuits involving hyperactive limbic regions and hypoactive prefrontal modulation-most pronounced in the dorsal lateral ...

THE NEUROBIOLOGY OF EMOTION Neural systems, the amygdala, and fear Is emotion a magic product, or is it a physiologic process which depends on an anatomic mechanism? -J.W. Papez, 1937 Throughout the day, we experience a variety of emotions. For the most part, these emotions are transient in nature. However, when these emotions become intense or are

The amygdala consists of a group of heterogeneous nuclei located in the medial portion of the temporal lobe and is involved in multimodal information processing important for emotional recognition and behavior. Its complex structure includes basolateral, centromedial, and cortical nuclear complexes that have extensive connections with several cortical and subcortical structures.

Neurobiology of PTSD. February 1, 2008. ... In the past decade or so it has become clear that our amygdala plays a similar role in mediating the types of fear conditioning first observed in animals. The key finding was that amygdalar damage inhibited the ability of the human brain to become conditioned to fear.

Amygdala dysregulation has been shown to be central to the pathophysiology of posttraumatic stress disorder (PTSD) representing a critical treatment target. Here, amygdala downregulation was targeted using real-time fMRI neurofeedback (rt-fMRI-nf) in patients with PTSD, allowing us to examine furthe ...

### **The neurobiology of emotion regulation in posttraumatic ...**

Downregulation of amygdala activity during neurofeedback training was associated with enhanced activation in PFC regions associated with emotion regulation as well as increased task-based connectivity to the PFC. Effective connectivity analyses suggested that amygdala regulation involves both top-down and bottom-up information flow with regard to observed PFC-amygdala connectivity.
